

## Two Dimensional Random Variable

### Discrete (Joint Distribution of Two Variables)

Let  $X$  and  $Y$  be two random variables associated with the random experiment  $E$  and  $E'$  respectively.

Let  $S$  be the sample space corresponding to the r.v. and  $S'$  be that of  $E'$ .

Let  $n(S) = n$  &  $n(S') = m$ .

Then  $\exists$   $nm$  pairs of values  $(x_i, y_j)$  ;  $i=1, \dots, n$   
 $j=1, \dots, m$

Let  $p_{ij}$  be the probability assigned to  $(x_i, y_j)$

i.e.,  $p_{ij} = \text{Prob}(X=x_i, Y=y_j) = P(X=x_i, Y=y_j)$   
 $i=1, 2, \dots, n$   
 $j=1, 2, \dots, m$ .

All possible values of  $(X, Y)$  and the corresponding probabilities  $p_{ij}$  can be shown in joint distribution as follows:

$X \backslash Y$	$y_1$	$y_2$	$y_3$	$\dots$	$y_j$	$\dots$	$y_m$	Total
$x_1$	$p_{11}$	$p_{12}$	$p_{13}$	$\dots$	$p_{1j}$	$\dots$	$p_{1m}$	$P_{1.}$
$x_2$	$p_{21}$	$p_{22}$	$p_{23}$	$\dots$	$p_{2j}$	$\dots$	$p_{2m}$	$P_{2.}$
$x_3$	$p_{31}$	$p_{32}$	$p_{33}$	$\dots$	$p_{3j}$	$\dots$	$p_{3m}$	$P_{3.}$
$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\ddots$	$\vdots$	$\ddots$	$\vdots$	$\vdots$
$x_i$	$p_{i1}$	$p_{i2}$	$p_{i3}$	$\dots$	$p_{ij}$	$\dots$	$p_{im}$	$P_{i.}$
$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\ddots$	$\vdots$	$\ddots$	$\vdots$	$\vdots$
$x_n$	$p_{n1}$	$p_{n2}$	$p_{n3}$	$\dots$	$p_{nj}$	$\dots$	$p_{nm}$	$P_{n.}$
Total	$P_{.1}$	$P_{.2}$	$P_{.3}$	$\dots$	$P_{.j}$	$\dots$	$P_{.m}$	1

As  $p_{ij}$  ( $i=1, 2, \dots, n$ ;  $j=1, 2, \dots, m$ ) represents the joint pmf of the joint random variable  $(X, Y)$ , therefore

$$\sum_{i=1}^n \sum_{j=1}^m p_{ij} = 1.$$

Marginal probability distribution:

The prob. dist. of the random variable  $X$  is given by

$$\begin{aligned} p_x(x_i) &= P(X=x_i), \quad i=1, 2, \dots, n \\ &= P(X=x_i \cap Y=y_1) + P(X=x_i \cap Y=y_2) + \dots \\ &\quad + P(X=x_i \cap Y=y_m) \\ &= p_{i1} + p_{i2} + \dots + p_{ij} + \dots + p_{im} \\ &= \sum_{j=1}^m p_{ij} = p_{i.} \end{aligned}$$

$$\therefore \boxed{p_x(x_i) = P(X=x_i) = p_{i.} \quad ; i=1, 2, \dots, n}$$

The prob. dist. of the random variable  $Y$  is given

by

$$\begin{aligned} p_y(y_j) &= P(Y=y_j) ; \quad j=1, 2, \dots, m \\ &= P(X=x_1 \cap Y=y_j) + P(X=x_2 \cap Y=y_j) + \dots \\ &\quad + P(X=x_i \cap Y=y_j) + \dots + P(X=x_n \cap Y=y_j) \\ &= p_{1j} + p_{2j} + \dots + p_{ij} + \dots + p_{nj} \\ &= \sum_{i=1}^n p_{ij} = p_{.j} \end{aligned}$$

$$\therefore \boxed{p_y(y_j) = P(Y=y_j) = p_{.j} ; \quad j=1, 2, \dots, m}$$

$$\text{Hence, } \sum_{i=1}^n p_{i.} = 1 \quad \& \quad \sum_{j=1}^m p_{.j} = 1.$$

## Conditional Distribution

The conditional distribution of  $X = x_i$  given  $Y = y_j$  is given by

$$P(X = x_i | Y = y_j) = \frac{P(X = x_i \cap Y = y_j)}{P(Y = y_j)}$$

$$P_{X|Y}(x_i | y_j) = \frac{p_{ij}}{p_{.j}}, \text{ provided } p_{.j} \neq 0.$$

The conditional probability distribution of  $Y = y_j$  given  $X = x_i$  is given by

$$P(Y = y_j | X = x_i) = \frac{P(X = x_i \cap Y = y_j)}{P(X = x_i)}$$

$$P_{Y|X}(y_j | x_i) = \frac{p_{ij}}{p_{i.}}$$

Table: Conditional dist. of  $X$  given  $Y = y_3$  (say)

$X$ :	$x_1$	$x_2$	...	$x_i$	...	$x_n$	Total
prob:	$\frac{p_{13}}{p_{.3}}$	$\frac{p_{23}}{p_{.3}}$	...	$\frac{p_{i3}}{p_{.3}}$	...	$\frac{p_{n3}}{p_{.3}}$	1

Table: Conditional dist. of  $Y$  given  $X = x_1$  (say)

$Y$ :	$y_1$	$y_2$	...	$y_j$	...	$y_m$	Total
prob:	$\frac{p_{11}}{p_{i.}}$	$\frac{p_{12}}{p_{i.}}$	...	$\frac{p_{1j}}{p_{i.}}$	...	$\frac{p_{1m}}{p_{i.}}$	1

$$P(Y = y_1 | X = x_1) \downarrow$$

$$P(Y = y_2 | X = x_1)$$

$$P(Y = y_j | X = x_1)$$

$$P(Y = y_m | X = x_1)$$

Ex. 1  $E$ : Tossing a coin,  $E'$ : Rolling a die, let  $X$  be the r.v. associated with  $E$  and  $Y$  be the r.v. associated with  $E'$ .

$$S = \{H, T\}, S' = \{1, 2, 3, 4, 5, 6\}$$

$\downarrow$        $\downarrow$   
 $1$        $0$

$$E'' = \text{Total no. on the faces}, S'' = \{1, 2, 3, 4, 5, 6, 7\}$$

let  $Z$  be the r.v. associated with  $E''$

$$Z=1 \rightarrow (0,1) \rightarrow \{X=0, Y=1\}$$

$$Z=2 \rightarrow (0,2), (1,1) \rightarrow \{X=0, Y=2\} \cup \{X=1, Y=1\}$$

$$Z=3 \rightarrow (0,3), (1,2) \rightarrow \{X=0, Y=3\} \cup \{X=1, Y=2\}$$

$$Z=4 \rightarrow (0,4), (1,3) \rightarrow \{X=0, Y=4\} \cup \{X=1, Y=3\}$$

$$Z=5 \rightarrow (0,5), (1,4) \rightarrow \{X=0, Y=5\} \cup \{X=1, Y=4\}$$

$$Z=6 \rightarrow (0,6), (1,5) \rightarrow \{X=0, Y=6\} \cup \{X=1, Y=5\}$$

$$Z=7 \rightarrow (0,7), (1,6) \rightarrow \{X=0, Y=7\} \cup \{X=1, Y=6\}$$

$$\text{Then } P\{Z=1\} = \frac{1}{12}, P\{Z=i\} = \frac{2}{12} = \frac{1}{6}, i=2, 3, 4, 5, 6$$

$$P\{Z=7\} = \frac{1}{12}$$

$$P_{ij} = P(X=i, Y=j) = \frac{1}{12}, i=0,1; j=1,2,3,4,5,6$$

$i \backslash j$	1	2	3	4	5	6	$P(X=i)$
0	$P_{01}$	$P_{02}$	$P_{03}$	$P_{04}$	$P_{05}$	$P_{06}$	$\sum_{j=1}^6 P_{0j} = P_{0\cdot} = P(X=0)$
1	$P_{11}$	$P_{12}$	$P_{13}$	$P_{14}$	$P_{15}$	$P_{16}$	$\sum_{j=1}^6 P_{1j} = P_{1\cdot} = P(X=1)$
$P(Y=j)$	$\sum_{i=0}^1 P_{i1}$						

$$= P_{\cdot 1}$$

Marginal prob. =  $P(Y=1)$

Example: The following table gives the joint distribution of  $x$  and  $y$ :

$x \backslash y$	2	3	7	Total
1	0.10	0.25	0.05	0.40
3	0.30	0.15	0.15	0.60
Total	0.40	0.40	0.20	1

- (i) How many pairs of values of  $x$  and  $y$  are possible? Write them down and show the corresponding probabilities.
- (ii) Show the marginal dist.s of  $x$  and  $y$
- (iii) Show the conditional dist. of  $x$  given  $y=2$ .
- (iv) Show the conditional dist. of  $y$  given  $x=3$ .
- (v) Find the probabilities  $P(X < X)$ ,  $P(2x+y \geq 9)$ .

Soln. (i)

$(x=i, y=j)$	$(1,2)$	$(1,3)$	$(1,7)$	$(3,2)$	$(3,3)$	$(3,7)$	Total
$P_{ij}$	$P_{12}=0.10$	$P_{13}=0.25$	$P_{17}=0.05$	$P_{32}=0.30$	$P_{33}=0.15$	$P_{37}=0.15$	1

$P(X=i) = P_{i.}$	0.40	0.60	1
$x=i$	1	3	Total

$y=j$	2	3	7	Total
$P(Y=j) = P_{.j}$	0.4	0.4	0.2	1

$x=i   y=2$	$(x=1   y=2)$	$(x=3   y=2)$
$P_{x y}(i 2)$	$P_{x y}(1 2) = \frac{P_{12}}{P_{.2}} = \frac{0.10}{0.4} = 0.25$	$P_{x y}(3 2) = \frac{P_{32}}{P_{.2}} = \frac{0.30}{0.4} = 0.75$

(iv) Conditional distribution of  $Y$  (given  $X=3$ )

$Y=j$	2	3	7	Total
$P_{Y X}(j 3)$	$P_{Y X}(2 3)$	$P_{Y X}(3 3)$	$P_{Y X}(7 3)$	
	$= \frac{P_{32}}{P_{3.}}$	$= \frac{P_{33}}{P_{3.}}$	$= \frac{P_{37}}{P_{3.}}$	
	$= \frac{0.30}{0.60}$	$= \frac{0.15}{0.60}$	$= \frac{0.15}{0.60}$	
	$= 0.50$	$= 0.25$	$= 0.25$	1

$$\begin{aligned}
 (v) \quad P(X < Y) &= P(X=1, Y=2) + P(X=1, Y=3) + P(X=1, Y=7) \\
 &\quad + P(X=3, Y=7) \\
 &= 0.10 + 0.25 + 0.05 + 0.15 \\
 &= 0.55.
 \end{aligned}$$

$$\begin{aligned}
 P(2X+Y \geq 9) &= P(X=1, Y=2) + P(X=1, Y=3) + \\
 &\quad P(X=1, Y=7) + P(X=3, Y=3) + P(X=3, Y=7) \\
 &= 0.05 + 0.15 + 0.15 = 0.35.
 \end{aligned}$$

Ans.

### Independent Variables

Two dimensional random variables  $X$  and  $Y$  are said to be independent if

$$P(X=x_i, Y=y_j) = P(X=x_i) P(Y=y_j)$$

i.e.,  $P_{ij} = P_{i.} \times P_{.j}$ ,  $i=1, 2, \dots, m; j=1, 2, \dots, m$

Example:

$X \backslash Y$	0	2	4	Total
2	0.06	0.15	0.09	0.30 $\rightarrow P_{2.}$
5	0.14	0.35	0.21	0.70 $\rightarrow P_{5.}$
Total	0.20	0.50	0.30	1

$\downarrow$   $P_{.0}$      $\downarrow$   $P_{.2}$      $\downarrow$   $P_{.4}$

Here,  $P_{20} = P_{.0} \times P_{2.}$

$$P_{22} = P_{.2} \times P_{2.}; P_{24} = P_{.4} \times P_{2.}; P_{54} = P_{.4} \times P_{5.}$$

$$P_{50} = P_{.0} \times P_{5.}; P_{52} = P_{.2} \times P_{5.}$$

Lecture 10 : P(6)

## Joint Cumulative Distribution Function

The joint cumulative distribution function of two random variables  $x$  and  $y$  is given by

$$F_{X,Y}(x,y) = \text{Prob} \{ -\infty < X \leq x, -\infty < Y \leq y \}$$

$$= \text{Prob} (X \leq x, Y \leq y)$$

$$-\infty < x < \infty, -\infty < y < \infty$$

To be a bona fide CDF, a fn. must satisfy the following properties, similar to those found in the CDF of a single r.v.

- $0 \leq F_{X,Y}(x,y) \leq 1$ .  $-\infty < x < \infty, -\infty < y < \infty$ .

- $F_{X,Y}(x, -\infty) = F_{X,Y}(-\infty, y) = 0$

$$F_{X,Y}(-\infty, -\infty) = 0, F_{X,Y}(+\infty, +\infty) = 1.$$

- $F_{X,Y}(x,y)$  must be a non-decreasing fn. of both  $x$  and  $y$ , i.e.,

$$F_{X,Y}(x_1, y_1) \leq F_{X,Y}(x_2, y_2) \text{ if } x_1 \leq x_2 \text{ \& } y_1 \leq y_2.$$

- the marginal cdf can be derived from the joint cdf as follows

$$\lim_{y \rightarrow \infty} F_{X,Y}(x,y) = F_X(x)$$

$$\lim_{x \rightarrow \infty} F_{X,Y}(x,y) = F_Y(y).$$

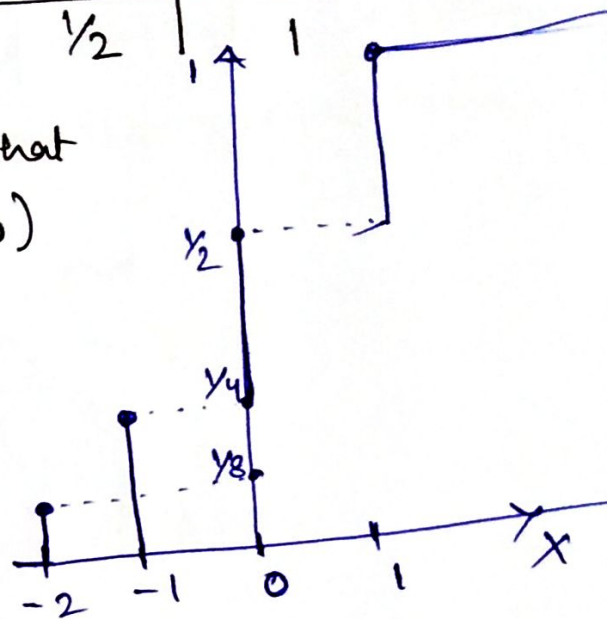

Example:- The cdf of a single discrete r.v.  $X$  is given in the tabular form as follows

$x$	$-2 < x$	$-2 \leq x < -1$	$-1 \leq x < 0$	$0 \leq x < 1$	$x \geq 1$
$F_X(x)$	0	$\frac{1}{8}$	$\frac{1}{4}$	$\frac{1}{2}$	1

From the table it is understood that

$$P(X < 1.0) = \frac{1}{2} = P(X < 0.5) = P(X \leq 0)$$

Similarly, the joint cdf of two discrete r.v.s  $X$  and  $Y$  can also be represented in the tabular form as follows

	$-2 < x$	$-2 \leq x < -1$	$-1 \leq x < 0$	$0 \leq x < 1$	$x \geq 1$	$F_Y(y)$
$y \geq 2$	0	$\frac{1}{8}$	$\frac{1}{4}$	$\frac{1}{2}$	1	1
$0 \leq y < 2$	0	$\frac{3}{32}$	$\frac{3}{16}$	$\frac{3}{8}$	$\frac{3}{4}$	$\frac{3}{4}$
$-2 \leq y < 0$	0	$\frac{1}{32}$	$\frac{1}{16}$	$\frac{1}{8}$	$\frac{1}{4}$	$\frac{1}{4}$
$y < -2$	0	0	0	0	0	0
$F_X(x)$	0	$\frac{1}{8}$	$\frac{1}{4}$	$\frac{1}{2}$	1	

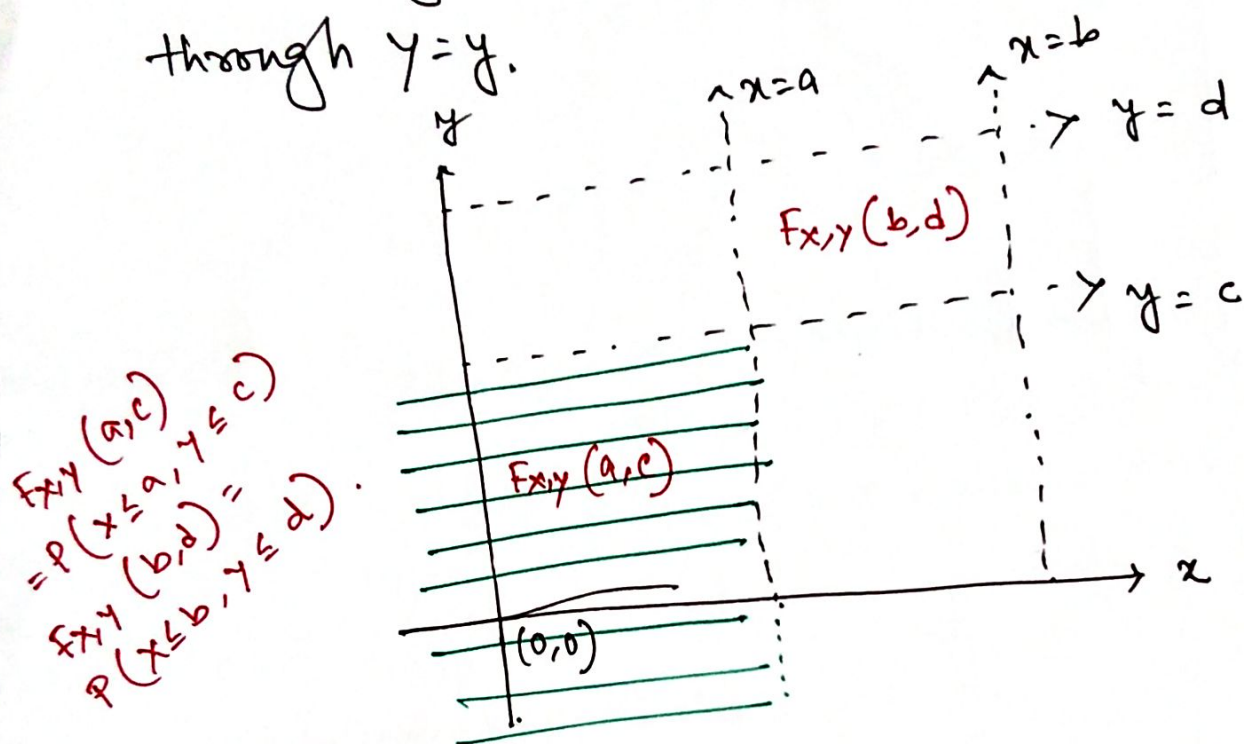

From table it is seen that

$$P(X < 1, Y < 0) = \frac{1}{8} = P(X \leq 0.5, Y < 0) \\ = P(X \leq 0.0, Y < 0).$$

Lecture 10 (P(8)) *Asanji*

The value of the cdf of two r.v.  $X$  and  $Y$  at a pt.  $(x, y)$  is the prob. of the event that contains all the outcomes that are mapped into the infinite area that lies to the left of a vertical line through  $X=x$  and below a horizontal line through  $Y=y$ .

$$\# P(a < X \leq b, Y \leq c) = F_{X,Y}(b, c) - F_{X,Y}(a, c)$$

$$\# P(X \leq a, c < Y \leq d) = F_{X,Y}(a, d) - F_{X,Y}(a, c)$$

$$\# P(a < X \leq b, c < Y \leq d) = F_{X,Y}(b, d) - F_{X,Y}(a, d) - F_{X,Y}(b, c) + F_{X,Y}(a, c).$$

clearly seen from the figure.
